## Report 1

Aash said:

We need to generate the whole website like dashboard and all other features provided by Samagama  
Sujala : new features not introduced in Samagara should be integrated for making the project stand out

Sagnik: improving chatbot so we can upload media

Sujala: simple dashboard design, Keyword matching to be done and sections are suggested by ai

Harsh: clickable link

Sagnik: notification feature

aarsh: escalation when ai can't answer

Harsh and aarsh: ambiguous queries shall be flag out

Arunaditya : setting priority on queries, categorization

Sujala: ai chatbot identifies queries if not unique , then it is not accepted

Aarsh: we make then go through faqs before , avoid putting much load on client

Someone: peer to peer communication at first then it will go to next level.

Harsh: time complexity and voice assistant

Answers will be rated and the answers rated least will be removed from queue and if it is rated enough it will be prioritised

Report created by ananya

## Report 2

Harsh AND aarsh: compare mode generated by ai and us, ai agent will be generated first

Data set extracted through site by sagnik

Sagnik: email feature to mail queries (but most of them aren't answered)

Team: feature of answering peer questions

Geethika: are faqs to be grouped

Ananya: multilingual support (not required)

Keerthna: chatbased system or question-answer format

Ananya: and aarsh: are we adding history to chatbot , history to be summarised and stored

Vedanth: training model on small faq set will result in overfit but we can use olama

Aryan: faq outside roles, without logging in you can see faqs

Saksham: dashboards to be added later

Aryan and harsh: database schema should be fixed either with mongodb or supabase, queries to be categorized

Aryan and vedanth: tokens can be used to move through pages without logging in again .

Saksham: We should start making prompts and work on defining proper schema for data to be used for training

Olama and ai provided by sir both will be used

Saksham: we should first create the faq page without login

Vedanth: snapshot can be uploaded to ai

Ananya : categorize the queries in frontend

Sujala and harsh : bullet points are easier to read but the dataset will need restructuring

Saksham: subcategories of the queries are to be created

Room 38 or 11 or 9 or 17

Aditya : Ai can take record of questions from zoom meeting (to be considered later)

Aarsh: website to be generated milestone by milestone

Vedanth: we can use grok for api but it will take time to be assigned, olama to be used in server only for reducing load on server

Aarsh: design to be kept humanised

Sujala: voice assistant can be added

Harsh and Saksham :admin confirm the answer to be actually true when the answer is flagged with full star rating, multiple peer can answer

Harsh: if none of the peer have answered after 48 hours it will be sent to the admin to answer

Saksham: penalty to be given for useless question and grouping queries and setting priority based on number ND severity

Vedanth:rag model interact at first through the faq page ,checking for answer through data in faqs but if it fails this request is served by llm grok which sends response or suggest if it should be escalated

Aarsh:rating answer give by rag so it falls back to LLM

Login credentials to be stored in dummy databases for authentication(we can add google authentication later)

Aryan:simple login mechanism to be used

Sagnik : created a prototype using the Grok API model.

Harsh and sagnik: identified a token usage problem. To solve this,he suggested that instead of sending all FAQs in every prompt, we should only provide FAQs related to the user's query. For example, if the query is related to an NOC, then only NOC-related FAQs should be included in the prompt. This can help reduce token usage and improve efficiency.

experimenting with different AI model options will be done . Initially, we will use Grok. If it does not perform well for our use case, we will switch to Ollama. If that also does not work effectively, then we will move to the system/recommended model that sir will provide to us.

## Report 3

User will login and then interact with the chatbot (even rag one)

Aarsh and keerthna : how about adding limit to asking questions(another thing to be done). Limit to active queries (max 5)

## Report 4

Aarsh: are responses from rag to be recorded

Harsh: rag response dont need to be recorded

Aarsh: faq database will be made where all the responses to be recorded are stores

Aaryan : Android design?

All : we will do that later

Room 38 or 11 or 9 or 17

Aarsh and Harsh : asked and frequently asked questions grouped separately , and store in database

Saksham:same questions not to be added multiple times priority set rather

Aaryan : grouping with the help of ai

Harsh: any new question to be given to rag (implemented)

Saksham : any question not answered by rag will be redirected to LLM WHICH answer and store the question and if similar question is answered user will be notified about it being answered waiting to be answered.

Prompt discussion

Vedanth: provide website link to take reference from it

Sagnik: changing answer in the faqs , how will they be handles(By admin)

Harsh:minimilistic ui black and white theme

Prompt drafting begins

## Report 5

Harsh:auto-suggestion window

Sujala: similar queries if asked then user is notified that this has been asked

Harsh: LLM and Rag analytics , monitored by admin

## Report 6

Prompting open code started

Milestone 0,1,2,3, and achieved

Fixes: explore faq not working and on clicking it again we have to log in

Upon clicking on any page redirected to sign in

Git wrong initialization

Milestone 5 achieved

Systems gets stuck at functions

Questions are getting escalated directly without reaching LLM(Solved)

Problem: rag is not approached when intended

Milestone 6 achieved

Milestone 7 achieved

How to scale and test it?
